01 Optimizing Business Environment in the Field of IP

CNIPA, jointly with six other government bodies, including the Ministry of Education, the Ministry of Science and Technology, the State Administration for Market Regulation, the State Financial Regulatory Administration, the National Copyright Administration, and the Chinese Academy of Sciences, formulated the *Opinions on Further Optimizing the Business Environment in the Field of Intellectual Property*, proposing a total of 65 reform measures. The reform tasks related to intellectual property in six aspects of the business environment innovation pilot program of the State Council

were completed; indicators related to intellectual property of China's business environment evaluation system were studied and determined by CNIPA in coordination with the National Development and Reform Commission (NDRC), and the business environment evaluation system in the field of intellectual property was improved; and the handling of the notification and commitment for patent fee reduction was steadily promoted, and CNIPA coordinated with the State Administration of Taxation to improve the verification on tax payment information of applicants for patent fee reduction.

02 Optimizing Government Services for Intellectual Property

The *Opinions on Promoting the Standardization, Normalization and Facilitation of Intellectual Property Public Services* were issued, and pilot programs for the standardization of intellectual property public services were carried out in 33 cities across the country and Xuhui District, Shanghai. The *Guidelines for Handling Intellectual Property Government Service Matters (Second Edition)* were revised and 72 handling guidelines were released, clearly stipulating service requirements such as the conditions for acceptance, acquisition channels, time limits, supervision and evaluation item by item, providing clear and comprehensive guidance

for the public to handle intellectual property business, and promoting the undifferentiated acceptance and uniform standard handling of intellectual property government services at the national level. The system of “positive” or “negative” comments on government services was launched for trial operation to establish a service evaluation mechanism that connects the entire process of evaluation, rectification, feedback and supervision, and achieve full coverage of online and offline evaluation of intellectual property government services.

03 Enhancing Efficiency of Intellectual Property Public Services

The classified guidance on intellectual property public services was strengthened. The *Guiding Opinions on Comprehensively Enhancing the Efficiency of Intellectual Property Public Services*, the *Work Guidelines for National Intellectual Property Information Service Centers at Colleges and Universities*, and the *Implementation Measures for the Registration of National Intellectual Property Information Public Service Outlets (Revised)* were issued.

The establishment of the second batch of 51 Technology and Innovation Support Centers (TISCs) in the second phase was started, three-year operation expert evaluation was conducted for the fourth batch of TISC institutions in the first phase, and pilot project for TISC was carried out in the Hong Kong Special Administrative Region; there were 483 national-level IP public service institutions, providing services to innovation entities over 1.45 million times throughout the year, and 13 comprehensive city-level IP public service institutions

were newly added, with a total of 175, and a coverage rate increasing to 52.6%; and IP public service workstations were set up in technology industrial parks nationwide, with a total of over 935.

CNIPA attached equal importance to inclusive services and key services, and promoted the in-depth implementation of IP public service inclusive projects in all regions. The collection of IP public service information was carried out, and the relevant problem demands of innovation entities were promptly collected; and guidance was provided in the IP public service enterprise-friendly connection action in Beijing, Guangdong and Jiangsu to promote over one thousand enterprises to reach connection service agreements with public service institutions. The achievements and typical practices of information public services were publicized and promoted, and the “Top Ten Cases” and “Outstanding Cases” of IP information services in 2024 were released.

04 Efficient Utilization of Intellectual Property Data Information

The development and utilization of data information were strengthened, and open licensing data of open patents were added, with basic data of 60 types of IPRs opened. The IP information public service products were continuously enriched and optimized, the “National Intellectual Property Public Service Website – a Government Service Platform of the CNIPA” was integrated and launched, releasing a list of local intellectual property public service platforms and special

databases. The query services for patent and trademark announcement information were launched on the National Government Service Platform to promote more affairs to be “handled online” and “checked on mobile devices”. Leading activities were created, and the Intellectual Property Public Service Patent Search and Analysis Competition was held for three consecutive years to promote the improvement of IP information service levels.

05 Improving Construction of Intellectual Property Informatization Infrastructure

The National Intellectual Property Protection Information Platform was established to achieve the basic functions of the national intellectual property big data center and the public service platform, gathering over 400 types of intellectual property data, and providing authoritative verification and centralized query services for the ownership information of four types of intellectual property, including patents, trademarks, integrated circuit layout designs, and geographical indications. Focusing on key areas such as

examination and granting, administrative law enforcement, and comprehensive supervision in the field of intellectual property, the levels of data sharing and work collaboration were enhanced across departments, regions and hierarchies, and data barriers in the fields such as IP administrative law enforcement and ownership information verification were overcome to achieve the reporting and sharing of information on IP administrative adjudication cases at the “national – provincial – municipal – county” four levels.

06 Patent Document Publication

6.1 Patent documentation resource

A total of 138 types of literature resources were allocated throughout the year, including 7 types of patent resources and 131 types of non-patent resources. Patent document exchange was carried out with 27 countries (regions) or organizations, and Chinese patent documents were presented to 5 PCT International Search and Preliminary Examination Authorities.

As of the end of 2024, 540 types of patent documentation resources were collected, including 191 types of bibliography data, 167 types of full-page image data, 83 types of full-text data, 18 types of thematic data, 72 types of auxiliary search data, and 20 types of other data. The bibliographic data, the full-page image data and the full-text data covered 104, 103 and 36 countries (regions) or international organizations, respectively.

6.2 Classification of patent documents

A total of 6.823 million patent documents were classified throughout the year. Among them, 1.877 million Chinese applications for invention patents were classified under the International Patent Classification (IPC) and the Cooperative Patent Classification (CPC), 3.263 million Chinese applications for utility model patents were classified under the IPC, and 25 thousand PCT international applications were classified under the IPC.

The book *International Patent Classification 2024.01 Edition* was published, and the *International Patent Classification 2025.01 Edition* and its definitions were translated and released. The obligation of international cooperation in classification was actively fulfilled, providing a total of 1.896 million pieces of CPC classification result data of newly published Chinese invention patent documents to the EPO.

6.3 Patent document publications

A total of 5.608 million patent gazette documents for inventions, utility models and designs were published throughout the year, including 1.911 million invention announcements, 1.045 million invention authorization announcements, 2.010 million utility model authorization announcements, and 642 thousand design authorization announcements.

The new version of the patent certificate was officially put into use on June 1, 2024 to better leverage its functions. As of the end of 2024, the national electronic patent application rate remained stable at 99.72%.
