

Collaborative Governance Regimes

Informing Practice through Research

KIRK EMERSON | MIN WOO AHN

Cross-sector collaboration takes many forms and works at a variety of scales in multiple policy domains. When issue complexity requires ongoing engagement of interdependent stakeholders in one or more sectors, systems of cross-boundary cooperation are needed to integrate across institutional structures, design and manage participation of diverse actors, and enable joint action and the creation of public value. These open and dynamic collaborative systems have been referred to as collaborative governance regimes. CGRs are systems of public governance where autonomous organizations work together over time to achieve some collective public purpose; they are specifically defined as “a particular mode of, or system for, public decision making in which cross-boundary collaboration represents the prevailing pattern of behavior and activity.”¹ Collaborative governance regimes occur at a variety of scales (local, subnational, national, cross-national, and global) and across different policy domains, from environmental to public health, emergency management, and public education.

This chapter offers a review of research on CGRs and some implications for practice. Following an illustration of the integrative framework for collab-

orative governance that encompasses CGRs (their system context, formation, collaboration dynamics, and actions),² the chapter offers an analysis of CGR research published by a range of social scientists since 2012. Finally, key findings are highlighted, and the chapter concludes with a discussion of the implications of this research for practice.

Defining the Integrative Framework for Collaborative Governance

Public administration scholars have been studying cross-sector collaboration since the 1990s, trying to understand how it works and what it achieves under what conditions. Collaborative governance is a complex phenomenon that involves many moving parts in dynamic relationship over time, connecting different institutional structures, multiple leaders, diverse stakeholders, and complicated substantive policy challenges. Numerous conditions and factors have been identified, and several analytic frameworks put forward to depict it.³ Kirk Emerson and others' CGR framework has integrated findings from over twenty years of research into a dynamic representation of the key interactive elements that compose and influence collaborative governance systems.⁴ In identifying and defining factors, researchers can better test and build theory around how they are related under different conditions. Public leaders and collaborative governance participants can draw on the conceptualization to better diagnose (and design) more robust cross-sector systems and to improve practice.

The framework takes as its starting point a system context from which drivers of cross-boundary collaboration emerge. The system context may include the public service or resources conditions in need of change, policy and legal frameworks, socioeconomic and cultural characteristics, network configurations, political dynamics and power relations, as well as the history of conflict among specific actors, organizations, and the public at large. This system context is dynamic and can influence the course of collaborative systems over time. The process displayed in figure 4-1 should be viewed as dynamic and not static.

Scholars of collaborative governance have pointed to many factors and conditions that stimulate cross-boundary collaboration.⁵ Drawing on this literature, the integrative framework highlights four key drivers that generate CGR formation:

- *Uncertainty* about the nature of a given public problem and how to address it and about the potential resources and future actions of others⁶

FIGURE 4-1. Integrative Framework for Collaborative Governance

- *Interdependence* among organizations that are unable to accomplish public goals on their own and require the assistance of others⁷
- *Consequential incentives* that make acceptance of the status quo situation undesirable, be they internal pressures (salient issues, resource needs, interests, or opportunities) or external pressures (situational or institutional crises, threats, or opportunities)⁸
- *Initiating leadership*, be it from the public, private, or nonprofit sector, that motivates the preliminary engagement of participants in a potential CGR⁹

Collaboration dynamics is at the heart of this process-oriented framework. They are composed of three interrelated and interactive processes: the relational or interpersonal dynamics among the actors (including the elements of trust, mutual understanding, internal legitimacy, and shared commitment); the behavioral dynamics among the actors (including joint discovery, shared definitions, interactive deliberation, and determinations or decisionmaking); and the functional dynamics of building the capacity for joint action (through combinations of procedural/institutional arrangements, leadership, knowledge, and resources). Through the iterative cycling of these collaboration dynamics, autonomous actors become participants in the CGR and develop a collective purpose, target goals, and a shared theory of change that underlies an agreed-upon path toward accomplishing those goals.

Collaboration dynamics within the CGR lead to collaborative actions by some or all of the participants. Implementation of these actions (or outputs, in the language of logic models) leads to outcomes consistent with the shared theory of change and, in turn, to impacts and adaptation (significant adjustments or transformative changes that potentially lead to adaptation within the system context, the CGR itself, or the theory of change itself).

To illustrate the framework, consider a hypothetical collaborative licensing process where a hydroelectric dam operator engages public- and private-sector stakeholders in commissioning studies and developing conditions for the renewal of their operating license from the US Federal Energy Regulatory Commission (FERC).¹⁰ The hydro-dam operator and those who are affected by its operation, as well as those who regulate it, are influenced by a host of factors within a surrounding system context or a socioecological system. This context shapes and gives rise to drivers that lead the dam operator to initiate a collaborative licensing process, such as the regulatory deadline for license renewal (consequential incentives); extreme weather patterns and energy price fluctuations (uncertainty); conflicts with an irrigation district seeking more water diversions (interdependence); and a proactive chief operating officer (COO) seeking to strengthen local relationships (initiating leadership). The COO chooses an alternative licensing process offered by FERC that provides a template for multistakeholder collaboration.

To continue, the COO follows the relicensing guidelines and invites upstream and downstream stakeholders (for example, public and private landowners, water users, public advocacy groups [environmental and energy], and representatives from public agencies) that can act as resources or have decisionmaking roles (that is, act as determining authorities) to work together to figure out if and under what conditions to request a license renewal from FERC. In such complex cases, an independent facilitator assists the participants in figuring out how to work together and how to mitigate conflicts if they arise.

The drivers motivate the participants to commit to a multiyear process. Over weeks or months of meetings, each participant reveals and advocates for their own interests and values and learns about others' issues and concerns as well. The participants become more focused and purposeful about their collective charge, more skilled in their deliberation, and more efficient in their internal decisionmaking. In this CGR, the repeated positive interactions create a virtuous self-reinforcing cycle that strengthens their relationships (shared motivation), their behaviors (principled engagement) and their functional use of

resources, expertise, knowledge, regularized regime structures and protocols, as well as shared leadership responsibilities (capacity or joint action).

This hypothetical exemplar, of course, is just that—a best-case scenario. Such collaboration dynamics may not develop in a straight line, and there will be setbacks: a key player will leave, a dispute will create an interpersonal rift, new knowledge will challenge prevailing assumptions, and money will run out. Some CGRs will not cohere or be sufficiently robust to withstand such internal shifts or external changes in the ongoing system context. Others will coalesce early on and forge ahead to create a bold agenda and a shared theory of change that is realized in actions and outcomes. By leveraging the CGR framework, researchers and practitioners are able to explore the motivations and incentives for collaborating, the leadership requirements and management finesse to build and sustain a cross-sector collaboration, as well as the substantive demands for solving a policy challenge.

Collaborative governance regimes can vary considerably by context, scale, and function, to name a few elements. Emerson and Tina Nabatchi developed a typology based on the nature of the policymaking challenge (is it acute, complex, or extensive?) and the configuration of the determining public authorities (are they diffuse, concentrated, or mixed?).¹¹ Three basic types of CGRs emerge: self-initiated, independently convened, and externally directed. These formative types vary in several ways, including the initiating leadership, initial structure, participant volition, and group autonomy. While public leaders may not always initiate a CGR, given the public nature of the policy issue, their formal and informal leadership as supporter, facilitator, expert, resource, and participant is vital.¹²

Examples of self-initiated CGRs include community-based collaboratives, ad hoc working groups, planning committees, and informal partnerships. For example, the Newtok Alaska Planning Group¹³ exemplifies a self-initiated CGR at the local level, and the Toronto Civic Action Alliance¹⁴ exemplifies a self-initiated CGR at the regional-metropolitan level. Examples of independently convened CGRs include independent fact-finding commissions, collective impact initiatives, and bipartisan policy coalitions. The Public Solutions model advanced by the National Policy Consensus Center uses a third-party support and facilitation model akin to independently convened CGRs.¹⁵ The National Collaborative for Higher Education¹⁶ exemplifies an effort to independently convene CGRs across multiple states, and the Military Community Compatibility Committee¹⁷ illustrates a local, independently convened CGR in Tucson, Arizona. Examples of externally directed CGRs include fed-

eral advisory committees; grant programs requiring collaboration, regional planning, or operating authorities; and legislatively mandated collaborations. The COTAS Guadalupe¹⁸ and Everglades Restoration Task Force¹⁹ cases are good examples of externally directed CGRs.

CGRs in Research and Practice

This chapter summarizes research studies of CGRs operating in a number of policy areas, including: alcohol and drug prevention, international vaccine development, renewable energy, integrated youth care, water governance, e-government, hydro-dam relicensing, and economic partnerships, among many others. Further, while much of the social science scholarship on collaborative governance has been conducted on cases in the United States, Europe, Australia, and New Zealand, recent studies also include CGR cases in Papua New Guinea, Romania, China, the Black Sea region, Ghana, and Antarctica as well as Belgium, the Netherlands, Switzerland, and Australia.

The authors analyze early research on CGRs²⁰ to learn how the integrative framework is being used, if it remains viable as a conceptual framework, how it might be refined, and what findings might be of importance to assist future research and practice.²¹ The early research on CGRs varies in purpose and methodology. As the integrative framework gains greater currency, the number of studies each year is increasing.²² The empirical CGR studies (see table 4-1) were developed for different purposes and, in some cases, more than one purpose: to describe cases using the framework; to test the framework; to build theory with the framework; to introduce new factors or conditions; and to apply or advance new methodologies. Over one-third of the papers present descriptive single and multi-case studies that use the CGR framework in whole or in part to illustrate and explain cases of cross-boundary collaboration. The range of the cases in terms of scale, policy area, and geographic location is instructive; from international environmental regimes in the Southern Ocean to national public health programs in developing countries to bike-sharing systems in Shanghai.²³ While most are local cases, a third are operating at national or international scales. Close to half of the studies are US-based. In some studies, researchers use the framework to evaluate the performance of the CGR and/or make prescriptive practice recommendations. This diversity of application suggests that our framework has broad utility.

The most frequent purpose of these studies is to test one or more of the propositions posed by the CGR framework.²⁴ For example, Nicola Ulibarri

measures the influence of system context, drivers, and collaboration dynamics (and its internal dimensions) on collaborative actions and outputs by studying twenty-four different collaborative efforts to license hydropower facilities sponsored by the US Federal Energy Regulatory Commission.²⁵ Constantina Hossu and others test the propositions about the four drivers of collaboration governance in the context of a natural resource conflict effort in Romania.²⁶

A quarter of the CGR studies seek to build new theory about collaborative governance. This research integrates elements of the CGR framework with other frameworks and theories from the literature to advance the understanding of key dimensions of collaborative governance. In one study, researchers highlight the effect of existing power on the course of collaboration building.²⁷ In another, researchers focused on the structural patterns of interaction in varying levels of collaboration process.²⁸ In yet another, the research examines the developmental dynamics of twenty-one documented CGRs to explore theories of change and uncover a number of potential predictors of successful collaboration over time.²⁹

Another quarter of the CGR studies introduce a new condition or factor that was overlooked or not given sufficient attention in the collaborative governance literature and the CGR framework. Thus, some study the role of technology use in collaborative problem-solving;³⁰ the importance of female participation and leadership;³¹ and the way in which different kinds of uncertainties effect CGRs during their development over time.³² Finally, there are a handful of studies that apply or advance new methodological tools to research on CGRs. These studies advance CGR research by better specifying and measuring components within the framework. For example, in one study, an array of new measures is developed as indicators to capture facets of collaboration in a social forestry model.³³ In another project,³⁴ researchers employ a network simulation method to explore how network and system conditions moderate the impact of group convening and design strategies. This summary of the multiple ways in which collaborative governance scholars are drawing on CGR affirms the continuing utility of the framework to advance research and to generate useable knowledge for future practice.

Key Findings

These studies confirmed the utility and viability of the integrative framework, in whole or in part, with several contributing new evidence for the relative value and contribution of individual and system-level factors and conditions.

We highlight findings by their relevance to the system context and drivers of CGRs, factors within collaboration dynamics that contribute to collaborative outputs, the developmental dynamics of CGRs over time, and, finally, measurement concerns.

SYSTEM CONTEXT AND DRIVERS

Several studies analyze system context and drivers. Leadership is the most frequently analyzed construct among system-level factors at all scales of application. Other contextual factors include the general network conditions, uncertainties, resources, the emergence of the nonprofit sector, and the political context. Most of the studies are of individual or multiple CGRs, but several address large policy sector-wide applications and transnational CGRs.³⁵ Another sectoral study analyzes how government-funded nonprofit agencies effectively deliver alcohol and other drug addiction treatment in western Australia through CGRs.³⁶

Three studies of CGRs at the transnational level demonstrate the need for formal legal and institutional infrastructure support for complex cross-boundary governance systems like the Black Sea Commission, vaccine product development partnerships, and the Convention for the Conservation of Antarctic Marine Living Resources.³⁷ A handful of studies note additional challenges for initiating CGRs in developing and non-Western countries, where there may be limited formal institutional infrastructure, fewer cultural norms for informal collaborative behavior, and weak or unstable leadership.³⁸

Studies that address the drivers of collaboration (interdependence, uncertainty, consequential incentives, and initiating leaders) find some drivers more critical than others. Leadership and consequential incentives were found to be most influential in one study,³⁹ and another study finds an important interaction between the two, suggesting that positive financial incentives, in particular, motivate leaders to form CGRs.⁴⁰ Uncertainty is considered not only as a driver but as an internal and an external condition that collaborative engagement can help minimize.⁴¹ Paradoxically, higher certainty contexts can lead to greater consensus by necessitating more participant interaction and, hence, more information sharing.

UNDERSTANDING PERFORMANCE

The majority of early CGR research draws on the full framework and attempts to explore relationships among the process factors delineated in collaboration dynamics and the actions or outputs of collaboration. A small number of stud-

ies seek to measure outcomes and adaptation directly or indirectly.⁴² Key conclusions include:

- General confirmation (when measured) of the contribution of collaboration dynamics to anticipated outputs (for example, implementable outcomes taking multiple stakeholder concerns into account)⁴³
- Evidence of the mutually reinforcing nature of principled dynamics, shared motivation, and capacity for joint action⁴⁴
- Demonstration of the critical role of “appropriate” leadership; the consequences of overly prescriptive and coercive public leadership on the one hand⁴⁵ and the value of more flexible and adaptive collaborative leadership on the other⁴⁶
- In addition to leadership, critical capacities for joint action include financial resources to assure CGR productivity.⁴⁷
- Accountability of CGRs depends not only on internal information flow within, principled engagement and external flows to member organizations and the public.⁴⁸

DYNAMICS

There is growing interest in the dynamic nature of CGRs as open systems that, once initiated, change over time.⁴⁹ In an analysis of twenty-one documented cases, researchers find a variety of developmental trajectories, but across most cases, there appears a peak in leadership, collaborative processes, accountability, and outputs/outcomes around the midpoint of the observed case period. This suggests that “even stable and healthy collaborations incur some decline in their robustness” over time.⁵⁰

MEASURING PERFORMANCE

It has been observed for some time that research on the performance of collaborative governance (outcomes and impacts) is difficult and rare. This is in part because we have not done a good job conceptualizing and measuring performance.⁵¹ Researchers find that significantly more studies focus on process and output variables and on social outcomes over ecological outcomes.⁵² Some researchers use perceptions of outcomes as a proxy for performance.⁵³ In another study, on the shift in the US Forest Service over time toward social forestry, researchers build indicators for collaboration dynamics to demonstrate

the presence of collaborative initiatives compared to product-focused partnerships. They find in one national forest significant increases in the latter since 2008 as opposed to the substantially slower rise in collaboration.⁵⁴ Finally, when attempting to measure CGR productivity, multiple dimensions should be considered.⁵⁵

Informing Practice from Research

The findings from these studies offer insights for public leaders and collaboration practitioners from all sectors:

- It is important that initiating leaders conduct careful assessments of the system context to understand the potential value and the challenges ahead. This is even more important in non-Western and developing countries, where collaboration challenges, particularly around culture and capacity, are significant.⁵⁶
- The complexity of assembling the right people (with diverse interests and institutional obligations) and the right collaborative platform requires a design approach. Initiating leaders should be aware of the different process technologies available to them and how to adapt their process and system design to the conditions in the system context (like the density of the network, preexisting conflict, difficult actors).⁵⁷ Indeed, the formation of a CGR may be seen as an adaptation to the system context.⁵⁸
- Building on the conceptualization of CGRs as systems, leaders should pay more attention to integration, both institutional and procedural, of informal systems of collaboration with formal institutions. This will enhance public legitimacy and strengthen accountability of collaborative actions that can be synchronized with regulatory requirements.⁵⁹ Process design should take into consideration and integrate the different or unfamiliar social practices of those in other sectors.⁶⁰
- Leadership continues to be an important factor in the success of CGRs, but there are different suggestions for what kind of leadership is required. One study emphasizes a collective approach to leadership, where multiple actors from different sectors take on leadership roles and responsibilities.⁶¹ The leadership role of the public-sector manager in particular is both essential and contested in the research: from one study, it is suggested she be more than an intermediary and actively engage with all stakeholders;⁶²

in another, it is recommended that her role should be confined to providing financial and technical resources.⁶³ Another study supports the need for “metagovernors to know when to allow for autonomy and dialogue, and when to use the shadow of hierarchy.”⁶⁴

- Securing sufficient resources, particularly financial and technical, continues to be a significant driver and contributor to CGRs.⁶⁵ This becomes all the more important when understanding that CGRs are ongoing systems, not short-term engagements, that will require sustainable support strategies as they develop over time.⁶⁶
- Process management, while not easy, remains essential to complex CGRs. Structuring the interaction among participants is one of the most important managerial responsibilities.⁶⁷ Within the interactive dimension of collaboration dynamics, the principled engagement process was found to consistently influence productive outputs and outcomes.⁶⁸ Managers, facilitators, and “metagovernors” should foster the self-reinforcing “virtuous cycling” of principled engagement, shared motivation, and capacity for joint action.

Conclusion

The research on collaborative governance is revealing patterns of interactions and relationships across a diverse range of settings and applications. The integrative framework is proving to be a useful template for conceptualizing and studying these complex, dynamic systems of cross-sector collaboration. From these systematic observations and analyses, we are confirming some of the practice wisdom of those engaged in leading and managing CGRs over the past decades as well as discovering new insights and deeper, more complex understanding of the workings of CGRs.

For research to generate reliable and useable knowledge for practice, it must continue to generate new scholarship, test and contest, as well as revise and refine, its premises in different settings and applications.⁶⁹ Reviewing the latest research on CGRs offers a glimpse of recent scholarship focused on one specific framework for approaching collaborative governance. It should remind us of the importance of continuing to monitor this and other streams of research on collaborative governance as well as encourage new avenues for research and new refinements for practice in the future.

21. We sought to restrict our search to the empirical study of CGRs for this paper. Since the citations included a very broad range of commentaries, literature reviews, theoretical papers, empirical studies, working papers, conference papers, and policy reports, we narrowed the search by restricting the citations to English language peer-reviewed empirical studies that focused on or incorporated aspects of the integrative framework for collaborative governance or CGRs. We excluded papers that were primarily conceptual or where the empirical analyses were not connected to some aspect of the CGR framework.

22. To identify published empirical studies on CGRs, we conducted a search of two databases, Web of Science and Google Scholar, using a software application that retrieves and analyzes academic citations (Publish or Perish [PoP]), <https://harzing.com/resources/publish-or-perish>. The primary search term was "collaborative governance regime," and the initial search yielded 293 citations for publications since 2012. After further screening for peer-reviewed empirical research among other criteria, twenty-eight studies were selected for further analysis in this chapter.

69. The CGR studies vary in their robustness and generalizability, as they vary in their purpose and methodology. Future research on different cases, at different scales and in different settings with different methodological tools, will continue to deepen our understanding of the workings of collaborative governance.
