(54) Title: CORONAVIRUS VACCINE

(57) Abstract: This disclosure relates to the field of RNA to prevent or treat coronavirus infection. In particular, the present disclosure relates to methods and agents for vaccination against coronavirus infection and inducing effective coronavirus antigen-specific immune responses such as antibody and/or T cell responses. These methods and agents are, in particular, useful for the prevention or treatment of coronavirus infection. Administration of RNA disclosed herein to a subject can protect the subject against coronavirus infection. Specifically, in one embodiment, the present disclosure relates to methods comprising administering to a subject RNA encoding a peptide or protein comprising an epitope of SARS-CoV-2 spike protein (S protein) for inducing an immune response against coronavirus S protein, in particular S protein of SARS-CoV-2, in the subject, i.e., vaccine RNA encoding vaccine antigen. Administering to the subject RNA encoding vaccine antigen may provide (following expression of the RNA by appropriate target cells) vaccine antigen for inducing an immune response against vaccine antigen (and disease-associated antigen) in the subject. In December 2019, a pneumonia outbreak of unknown cause occurred in Wuhan, China and it became clear that a novel coronavirus (severe acute respiratory syndrome coronavirus 2, SARS-CoV-2) was the underlying cause. The genetic sequence of SARS-CoV-2 became available to the WHO and public (MN908947.3) and the virus was categorized into the betacoronavirus subfamily. By sequence analysis, the phylogenetic tree revealed a closer relationship to severe acute respiratory syndrome (SARS) virus isolates than to another coronavirus infecting humans, namely the Middle East respiratory syndrome (MERS) virus. On February 2nd, a total of 14'557 cases were globally confirmed in 24 countries including Germany and a subsequent self-sustaining, human-to-human virus spread resulted in that SARS-CoV-2 became a global epidemic.

Patent analytics
can help!

What is IP analytics?

Leveraging the wealth of knowledge contained in IP data (mostly patents) to provide added-value information and support informed decision making

What is patent analytics?

Analyzing different patent fields to identify technology trends, key and emerging players, existing and potential markets, opportunities and collaboration

Scope varies – from very narrow to very broad

Type of analysis and insights vary depending on the specific needs and questions to be answered

> Patent Landscaping

> Patent Analytics

> Patent Knowledge

> IP Analytics

> IP Intelligence

Why patent analytics?

>100m published patent documents worldwide

>3m patent applications worldwide per year
Technical information never published elsewhere

Highly standardized format (recognized indicator
for science and technology (S&T) output and
innovation tracking)

→ **A unique source of information**

Patent filings for unique inventions amounted to
2.14 million in 2020

Patent applications and patent families worldwide,

What partnership opportunities are available?

What new technology
should be patented?

What are the strengths and weaknesses
of our own patent portfolio?

Where should we invest our R&D resources?

Patent analytics for investors

Which companies are most active in patenting of a particular technology?

What are current technology trends?

Who is actively acquiring patents in the sector?

Patent analytics for inventors, researchers and universities

What new technology should be patented?

What is the leading
technological solution
in the area?

What companies can we partner with to
commercialize our research?

Unlocking the value of patent data

Patent analytics presents patent data, search results and findings in a **structured way**

Creates an output that makes technical data **easily understood by non-experts**

Includes **visualization of the results** making the information **easy to digest**

Facilitates interdisciplinary dialogue between various stakeholders

The hidden power of IP analytics: How can Sri Lanka add value to their natural resources?

Pulmoddai mineral sands

Vein graphite

Case study: Graphite in Sri Lanka

Vindya Wijesinghe, Senior Innovation Officer, NIA:

“Sri Lanka is very rich in minerals, and has the purest graphite. It is being called black gold. The problem is we have been exporting the majority of it only as the raw materials. Simply exporting the mineral ore is not as profitable as first converting it into useful products and then selling them. But, what products?”

With WIPO support, NIA decided to take a closer look at patents related to graphite, with the idea of identifying technology areas that were not already saturated with patent filings.

Patent Landscape Graphite and its applications

Graphite is an indispensable material in a variety of applications owing to its excellent electrical and thermal conductivity, good chemical stability and corrosion resistance. A patent landscape graphite is shown here, based on relevant patent applications filed from 2012 to 2021.

China dominated patent filings, with more than 47,000 patent families

Comparison of graphite-related patent families filed in China and rest of the world, by earliest priority year, 2012–2021.

Besides China, inventions have been concentrated in just a few other geographical regions.

Graphite-related patent families for the top 10 origins, by earliest priority year, 2012–2021.

Patent families on graphite processing

Flake graphite and artificial graphite were the two preferred primary graphite sources. Exfoliation techniques for bulk graphite processing are well-established. Battery applications were a key driver, and will continue sustaining global graphite-related innovation.

These insights are invisible without proper IP analytics

WIPO MAGAZINE

How Patent Information Can Help Spot Technology Gaps and Catalyze Economic Development

November 2023

By *Lakshmi Supriya*, Technology and Innovation Support Division, WIPO

This is exactly what Wijesinghe and her team at NIA are doing. They are using the insights from patent analytics as foundations on which to build and advance their innovation journey. "These reports are catalysts for shaping the mineral roadmap and policy in Sri Lanka," she says.

Commercial analytical tools

The patent analytics process

The question defines the scope

WIPO Technology Trends Reports

- Flagship publication
- Broad scope
- Patents, TMs, Designs, expert interviews
- New indicators

WIPO Patent Landscape Reports

- Narrower focus, snapshot of a technology area
- Mainly patents

WIPO Technology SPARK Reports

- Concise, shorter pieces of analysis
- Quick insight into emerging technologies

Stage 1
Topic and
scope definition

Stage 2
Patent search

Stage 3
Data cleaning/
normalization

Stage 4
Data analysis
and visualization

Stage 5
Narrative and
storytelling

Stage 6
Dissemination

Topic and scope definition

The importance of a clear project specification

- Detailed understanding of the business need (the question behind the question)
- Brainstorming and discussion to better define the specification
- Sufficient background information
- Defining project scope and the most useful and appropriate analysis – an iterative process

Managing expectations

- Options and limitations of patent analytics
- Timelines and feasibility

Stage 1
Topic and
scope definition

Stage 2
Patent search

Stage 3
Data cleaning/
normalization

Stage 4
Data analysis
and visualization

Stage 5
Narrative and
storytelling

Stage 6
Dissemination

Patent search

Selecting the most appropriate data source

- Required geographical and historical coverage

Iterative search strategy

- Preliminary searches to explore the field and define approach (classification and/or keyword)
- Search strategies need to be tailored and refined such as to optimize precision and recall

Minimize dataset noise

- Aim is to eliminate false positives and false negatives (although the reality is the minimize these)

How many retrieved
items are relevant?

$$\text{Precision} = \frac{\text{True positives}}{\text{True positives} + \text{False positives}}$$

How many relevant
items are retrieved?

$$\text{Recall} = \frac{\text{True positives}}{\text{True positives} + \text{False negatives}}$$

Stage 1
Topic and scope
definition

Stage 2
Patent search

Stage 3
Data cleaning/

Stage 4
Data analysis
and visualization

Stage 5
Narrative and
storytelling

Stage 6
Dissemination

Data cleaning / normalization

A critical step

- How does the exported data look? Applicant / inventor name variations and misspellings, patent number normalization etc
- Clustering / grouping (by affiliation, M&A information etc)
- Manual or semi-automatic (commercial data providers often have their own data cleaning tools built-in that aim to reduce the data cleaning workload)
- If you do not clean your data then any analysis derived from it will be wrong (applicants, inventors, CPC/IPC)

Stage 6
Dissemination

Data analysis and visualization

Allow yourself to be led by the data

- Avoid using a predefined list of charts/graphs
- Make sure the analysis covers the questions to be answered

Technology monitoring

- ✓ Which technology trends exist and how have they developed over time?
- ✓ Where are the crowded areas?

R&D decision-making

- ✓ Are there any gaps or white spaces, i.e. areas with little patent protection, that permit business opportunities?
- ✓ What further applications or uses are possible?
- ✓ Which further adaptations or embodiments could be explored?
- ✓ Identify solutions for technical problems

Competitors monitoring

- ✓ Which players are the most active?
- ✓ Patent portfolio of competitors?
- ✓ Who bought or sold IP rights?

Investment and collaboration decisions

- ✓ Which other patents are most relevant for our own activities?
- ✓ Check for potential infringements of IP rights (FTO, product clearance; in licensing)
- ✓ Monitor expiry of protected technologies for later use
- ✓ Identify business opportunities (out-licensing; potential partners with know-how; marketing opportunities)

Stage 1
Topic and scope
definition

Data analysis and visualization

Simplicity is a virtue

- Humans naturally focus on information that stands out (peaks etc), and we tend to look for patterns and draw our own conclusions
- The same information can be presented in multiple ways so experiment to see which is the most appropriate, and more self-explanatory visualization

Distribution of patent applications across vaccine Platforms

48% of the vaccine patent dataset related to protein subunit vaccines, followed by patent filings related to viral vector vaccines), which accounted for 22% of the vaccine patent dataset.

Conventional vaccine platform Novel vaccine platform

Patenting activity related to COVID-19 vaccines and therapeutics is nearly equally distributed between companies and universities/research organizations

Contribution to COVID-19-related vaccine datasets, by patent applicant profile

Contribution to COVID-19-related therapeutic datasets, by patent applicant profile

Patent applications related to COVID-19 in general, COVID-19 vaccines and COVID-19 therapeutics

COVID-19-related patent application filing peaked in April 2020, followed by a corresponding peak in COVID-19-related publications in October 2021

Applicant locations

Most patent applications were filed by patent applicants in China and the United States.

Figure 11. Network analysis of the top collaborating entities in COVID-19 vaccine patent applications

Among COVID-19 vaccine patents, Chinese companies and research institutions show greatest cooperation, followed by French corporates and research institutions.

Figure 15. Network analysis of top collaborating entities in COVID-19 therapeutic patent applications

Analysis shows four main collaborating communities: a community primarily composed of United States and European universities and research institutions (purple), a group centered around two French research institutions, CNRS and INSERM (orange), a group centered around research institutions from the Republic of Korea (blue) and a group primarily composed of Chinese corporate entities and research institutions (gray).

Note: Any additional programs not present in the two data sources are not represented in this figure. Source: Based on data from the World Trade Organization and WIPO, December 2022.

Narrative and storytelling

Tailored to the audience

- Report style, language and length should be adapted to the target audience
- Multiple reader profiles (e.g. lawyers, managers, scientists)
- The report should be easy to read, the messages and results clear and the visualizations intuitive and meaningful

Bringing the report to life

- An accompanying infographic, a storytelling approach, and/or a dashboard may be appropriate based on specific objective of the report
- Do not underestimate the importance of this step to ensure your report lands well

The rise of AI-powered patent analytics tools

- The number of patent analytics platforms utilizing artificial intelligence is proliferating
- AI algorithms that run them have developed substantially in recent years
- Vast quantities of patent data can now be analyzed much more quickly

AI tools are changing the patent analyst's role

- AI tools will not replace the analyst
- But the use of AI tools will allow day-to-day tasks to be completed much faster
- And potentially deeper insights will be uncovered to better inform decision making
- AI tools are already very effective at speeding up data cleaning
- Massive improvements made in AI-assisted patent search too
- ChatGPT data storytelling?

Many people often
think of IP analytics
as patent analytics

But patents are
just one piece of
the IP bundle

The innovation-to-market journey

The innovation-to-market journey

The innovation-to-market journey

Each dataset sits at a different point in the innovation-to-market chain

BUT...

they need to be interpreted and analyzed differently

Patents

Trademarks

Industrial Designs

The IP bundle

	Patents	Trademarks	Industrial Designs
Signal of	R&D pipeline	Market entry/ branding	Product aesthetics/ consumer appeal
Filing stage (<i>typical</i>)	Early (pre-market)	Near launch	Just before consumer release
Risks	Tech hype/unused filings	Clutter/defensive marks	Style overuse/ imitation
Example	mRNA vaccine patents	“BioNTech” trademark	Syringe kit design

BIONTECH

Analyzing the IP bundle

- The questions we ask of trademark or design data are different
- We are not looking for new inventions; we are looking for commercial strategies, branding bets or design differentiation

And remember:

**Statistics ≠
Insight**

A spike in filings could mean growth, clutter or noise – depending on the context

Trademarks

Number of Filings: **3,725,444**

Annual Growth: **5.8%**

Industrial designs

Number of Filings: **350,721**

Annual Growth: **1.4%**

Top filing jurisdictions of trademarks related to transportation

Goods

Services

Number of trademarks

Protection jurisdictions of transportation-related industrial designs

It's more than just the IP data...

Assistive Technologies – assessing Technology Readiness Levels (TRLs)

WIPO FOR OFFICIAL USE ONLY

COVID-19-related technology agreements

A brief summary

IP analytics is a strategic tool

Leveraging the wealth of knowledge contained in IP data (primarily patents, but also trademarks and designs) to provide added-value information and supporting informed decision-making

Who (top players) does **what** (technology trends, IP portfolio analysis), since **when** (evolution of filings over time), **where** (markets where protection is sought) and **with whom** (cooperation)

Complement with non-IP data (litigation, M&As, social media and news analysis, R&D investment figures, licensing) to complete the picture

Thank you
