Let's connect on LinkedIn:

What is IP analytics?

Leveraging the wealth of knowledge contained in IP data (mostly patents) to provide added-value information and support informed decision making

What is patent analytics?

Analyzing different patent fields to identify technology trends, key and emerging players, existing and potential markets, opportunities and collaboration

Scope varies – from very narrow to very broad

Type of analysis and insights vary depending on the specific needs and questions to be answered

> Patent Landscaping

> Patent Analytics

> Patent Knowledge

> IP Analytics

> IP Intelligence

Target audience

Government

Business

Investors

Researchers

Patent analytics for government

Do we have start-ups to support?

How to develop our
industrial policy?

What are the technologies to come?

The hidden power of IP analytics: How can Sri Lanka add value to their natural resources?

Pulmoddai mineral sands

Vein graphite

Case study: Graphite in Sri Lanka

Vindya Wijesinghe, Senior Innovation Officer, NIA:

“Sri Lanka is very rich in minerals, and has the purest graphite. It is being called black gold. The problem is we have been exporting the majority of it only as the raw materials. Simply exporting the mineral ore is not as profitable as first converting it into useful products and then selling them. But, what products?”

With WIPO support, NIA decided to take a closer look at patents related to graphite, with the idea of identifying technology areas that were not already saturated with patent filings.

IP analytics at WIPO

WIPO Technology Trends series

- Big-scale patent landscaping exercise with additional data analysis, contextualization and expert inputs
- 2019: Artificial Intelligence
- 2021: Assistive Technologies
- 2025: Future of Transportation

Patent analytics methodological resources

- WIPO guidelines for preparing patent landscape reports
- Manual on free and open-source tools for patent analytics
- Handbook on patent analytics

WIPO Patent Landscape Report series

- Exploring patent trends in specific technologies
- Over 20 PLR reports on various topics prepared since 2010
- New PLRs in 2024 includes Generative AI, Agrifood, and SDG-related patents
- Compilation of publicly available PLRs

WIPO Technology SPARK Report series

- Concise analytical insights on emerging technology trends and IP landscapes

Patent analytics training

- Introductory and advanced training webinars/seminars and workshops

Three Tiers of WIPO IP Analytics

Three publication series differing in scope, depth, timelines, resources and governance

The question defines the scope

WIPO Technology Trends Reports

- Flagship publication
- Broad scope
- Patents, TMs, Designs, expert interviews
- New indicators

WIPO Patent Landscape Reports

- Narrower focus, snapshot of a technology area
- Mainly patents

WIPO Technology SPARK Reports

- Concise, shorter pieces of analysis
- Quick insight into emerging technologies

A large, solid blue geometric shape in the top right corner of the slide, consisting of several connected line segments forming a jagged, abstract form.

Preliminary Analysis for Viet Nam's Strategic Technologies

Our approach

- Viet Nam has identified ten Strategic Technologies, and the goal is to determine which technology areas may be suitable for further patent analytics work. The approach combines two lenses using WIPO's Innovation Capabilities Navigator alongside patent data
- The Innovation Capabilities Navigator shows where Viet Nam has underlying capability and which fields Viet Nam may be well-positioned to develop
- Patent data shows observed inventive activity, such as what Viet Nam-based applicants are filing, how quickly tech fields are growing, and which institutions drive these tech fields

Step 1: WIPO Innovation Capabilities Navigator

- Maps innovation ecosystems using big data from patents, trademarks, publications, and exports
- Reveals capability networks and diversification pathways comparing each economy's capabilities today with where they stood 10 years ago, and where they could go next
- Provides evidence-based insights for policymakers and industry leaders

<https://www.wipo.int/en/web/economics/innovation-capabilities>

What are Innovation Capabilities?

*They represent the abilities of an **innovation ecosystem** to deliver competitive outputs in the different fields of innovation.*

Precision manufacturing

Biotechnology

Electronics

Fintech

Mapping the global innovation landscape

*WIPO Department of Economics and Harvard
Kennedy School joint methodology*

- *2,508 innovation capabilities across science, technology, entrepreneurship, and production.*
- 193 economies.
- 25 years of historical data.

Mapping the global innovation landscape

WIPO Department of Economics and Harvard Kennedy School joint methodology

- Billions of data points from international sources of innovation.
- Trillions of connections between fields, ecosystems and periods...

Transformed into indicators for actionable insights for ecosystems and industries.

Source: Innovation Capabilities Outlook 2026

Mapping the global innovation landscape

Key findings of the Innovation Capabilities Outlook 2026:

- Only 1/3 of economies improve their capabilities every year.
- Technologies are the hardest capabilities to master and are getting incrementally complex.
- The world has an untapped potential of >300K extra patents.
- Strategic innovation policy cannot rely on one-size-fits-all approaches.

Source: Innovation Capabilities Outlook 2026

Identifying local capabilities for policy action (1)

Key diagnostics of the Innovation Capabilities Navigator 2026 for Viet Nam:

- Viet Nam produces 3/4 the innovation its GDP share would predict.
- Viet Nam masters 12.8% of all possible innovation capabilities.
- 59% of Vietnamese capabilities are of **low-complexity** (high replicability).
- Viet Nam has potential to increase its innovation share by 5% by activating **untapped capabilities**.

Source: Innovation Capabilities Navigator 2026

How much does Viet Nam contribute to innovation?

Source: Innovation Capabilities Navigator 2026

Where does Viet Nam have innovation capabilities?

Source: Innovation Capabilities Navigator 2026

Where does Viet Nam have innovation capabilities?

Source: Innovation Capabilities Navigator 2026

Where does Viet Nam have untapped potential?

Viet Nam's global innovation output could reach **0.67%** by strengthening the connections between its capabilities. The fields with greatest potential are in **Engines and transport, Civil engineering and Processing and environmental**.

● Current share → Positive - - → Negative

Technology

Entrepreneurial

Science

Identifying local capabilities for policy action (2)

Key insights of the Innovation Capabilities Navigator 2026 for Viet Nam:

Source: Innovation Capabilities Navigator 2026

Summary: Viet Nam is a large innovation ecosystem with high diversity of low complex capabilities

Viet Nam is defined by its unique mix of capabilities across its scientific, technological, entrepreneurial, and productive outputs. Its size, or relevance, reflects its share of global innovation output, its diversity captures how broadly it is active across the world's innovation fields, and its complexity indicates how sophisticated and knowledge-intensive those capabilities are. These three diagnostic views describe where Viet Nam stands today, where it stood 10 years ago, and where it could stand by fulfilling its untapped potential.

Step 2: Patent data

- Maps Vietnam's technological strengths and emerging areas using worldwide patent data
- Reveals where Vietnamese-owned entities are developing, protecting and expanding technological capabilities, including changes over time
- Provides evidence-based insight into technology trends, key players and opportunities for strategic technology development

- Simple patent families, Viet Nam-based applicants, publication years 2006-2026
- Retrieved ~11,000 patent families (inventions)

#	VN STRATEGIC TECHNOLOGIES	IPC/CPC Set	VN TECHNOLOGY PRODUCTS
1	Digital technologies (artificial intelligence, big data, digital twins, cloud computing, edge computing, Internet of Things, blockchain)	G06N, G06F, G06Q, H04L, G06V, G16Y, G05B	- Large language models, virtual assistants and specialized artificial intelligence (AI) - Edge-processing AI cameras - Digital twin platforms - Cloud computing platforms - Blockchain network infrastructure and origin traceability systems
2	Mobile network technologies	H04W, H04B7, H04L, H04J, H04Q, H04M	5G/5G-Advanced mobile network equipment and systems
3	Robotics and automation technologies	B25J, G05B19, G05D, B23Q, B65G	- Autonomous mobile robots and industrial robots - Platforms, solutions and models serving smart manufacturing
4	Biotechnology and advanced biomedical technologies	C12N, C12Q, C07K, G16H, G16B, C12M, C12P	- Next-generation vaccines for human use - Cell therapies (stem cells, immune cells) for human use - Personalized medical product manufacturing systems applying 3D printing technology - Smart biosensor systems - Next-generation vaccines and biological preparations for use in animal husbandry, veterinary medicine, aquaculture, crop cultivation and plant protection - Systems for production, harvesting and deep processing of agricultural products, by-products and biomass - Next-generation plant varieties, livestock and aquatic breeds created from cell technology, gene editing and biotechnology
5	Energy and advanced materials technologies	H01M, H02S, F03D, H10F, Y02E, C08F, C08G, C08L, C01B, B82B, B82Y, C04B, C22C	- Advanced materials and high-performance functional materials for processing and manufacturing industries - Advanced batteries, accumulators and integrated battery energy storage systems (BESS) - Systems for production, storage, transportation and distribution of green hydrogen and biofuels - High-voltage and ultra-high-voltage electrical equipment; electric machines, electric motors and modern high-efficiency power transmission and drive systems - Carbon capture, utilization and storage (CCUS) systems - Small modular nuclear reactors (SMR)
6	Semiconductor chip technologies	H01L, H10, G03F, G11C, B81B, B81C	Specialized chips (application-specific / custom chips)
7	Cybersecurity and quantum technologies	H04L9, G06F21, G06N10, H10N60	- Cybersecurity and network security solutions for critical infrastructure and national databases - Quantum communication, quantum computing and quantum sensors
8	Marine, ocean and subsurface technologies	B63B, B63G, B63H, B63C, E21B7/12, E02B3, E02B17	- Systems for extraction, deep processing and deep-processed products from minerals, oil and gas, and rare earths - Systems, equipment, services and technology solutions for subsurface exploration, deep-sea operations, offshore structures and offshore energy
9	Aerospace and space technologies	B64	- Unmanned aerial vehicles (UAVs) equipment and platforms; systems for management, detection, monitoring and countermeasures against UAVs - Satellites and low Earth orbit (LEO) satellite constellations for Earth observation
10	High-speed rail and urban rail technologies	B61, E01B, B60M, B60L13	- High-speed railway construction works - Industrial platforms, vehicles, equipment and integrated systems for high-speed rail and urban rail

- Viet Nam's patenting base is expanding
- But Viet Nam's broader technology capability remains narrow compared with its strong and diversified production base
- The patent data identifies where Viet Nam-based applicants are already inventive
- The Innovation Capabilities Navigator indicates whether those activities correspond to established capabilities or to fields that Viet Nam may be well positioned to develop

Viet Nam's Strategic Technologies:

Five areas where WIPO sees potential

- **Digital technologies** present the strongest combination of rapid growth, meaningful filing volume and alignment with Viet Nam's existing capability in high-sophistication ICT. However, applicant concentration, particularly around Viettel, should be assessed to determine how broadly the capability is distributed.
- **Semiconductor chip technologies** are especially relevant as an advanced capability area as they align directly with one of Viet Nam's few existing high-sophistication technology strengths and show strong recent patent growth, although activity remains relatively low-volume and largely research-led.
- **High-speed rail and other advanced transport technologies** have a comparatively limited domestic patent base, but the WIPO Innovation Capabilities Navigator identifies related opportunities in engines and transport and civil engineering.
- **Energy and advanced materials**, particularly technologies related to industrial processing, environmental solutions, materials and chemical technologies, combine an established and diversified patent base with some of the WIPO Innovation Capabilities Navigator's opportunities for higher-sophistication upgrading.
- **Robotics and automation** remains a relevant enabling field for manufacturing upgrading, but its moderate growth and less direct alignment with the WIPO Innovation Capabilities Navigator make it less striking than the areas above. While mobile networks, aerospace, cybersecurity and quantum technologies are growing quickly, their relatively limited domestic applicants suggest that growth alone should not by itself be interpreted as a broad national technological capability.

Viet Nam's Strategic Technologies: Five areas where WIPO sees potential

- **Digital technologies** present the best combination of rapid growth, meaningful filing volume and alignment with Viet Nam's existing capabilities in high-sophistication ICT. However, applicant concentration, particularly around Viettel, should be assessed to determine how capability is distributed.
- **Semiconductor chip technologies** are highly relevant as an advanced capability area as they align directly with one of Viet Nam's few existing high-sophistication technology strengths and show strong recent patent growth, although activity remains relatively low-volume and largely export-led.
- **High-speed rail and other advanced transport technologies** have a comparatively limited domestic patent base, but the WIPO Innovation Capabilities Navigator identifies related opportunities in engines and transport and civil engineering.
- **Energy and advanced materials**, particularly technologies related to industrial processing, environmental solutions, materials and chemical technologies, combine a well-established and diversified patent base with some of the WIPO Innovation Capabilities Navigator's opportunities for higher-sophistication upgrading.
- **Robotics and automation** remain a relevant enabling field for manufacturing upgrading, but its moderate growth and less direct alignment with the WIPO Innovation Capabilities Navigator make it less striking than the areas above. While mobile networks, aerospace, cybersecurity and quantum technologies are growing quickly, their relatively limited domestic applicants suggest that growth alone should not by itself be interpreted as a broad national technological capability.

What would you like WIPO patent analytics support to help you decide?

- **Where does Viet Nam have existing technological strength?** Which specific technologies within the 10 strategic areas show strong or emerging capabilities among Vietnamese applicants?
- **Where are the technology gaps and opportunities?** Which technologies are less developed in Viet Nam but may offer opportunities for domestic companies to build capabilities or establish a foothold?
- **Where should Viet Nam look externally for technology?** Which technologies are at the state of the art internationally, and where might there be opportunities to acquire, license or otherwise access technologies developed abroad?
- **Who could Viet Nam partner with?** Which companies, research institutions or other organizations are leading in relevant technologies and could represent potential partners, licensors or sources of technology?
- **What does the technology landscape imply for policy and investment?** How could the analysis inform decisions about R&D priorities, investment, capability development, technology transfer or other domestic policy interventions?

Which of these questions are most important to you?

What deeper analysis could answer

- **Vietnamese capability** Where are Vietnamese applicants active? Which technologies are growing? Who are the key domestic players? Where are capability gaps?
- **Global landscape** Who leads internationally? How is the technology evolving? Where is the activity concentrated geographically? What are the emerging technology niches?
- **Technology opportunities** Where are potential white spaces? Which technologies could complement Vietnamese capabilities? Where might technology access be strategically important?
- **Potential partners** Who owns relevant technologies? Which companies/research organizations are active? Where are potential licensing, collaboration or technology-transfer opportunities?
- **Implications** What could Viet Nam develop domestically? What could be accessed externally? Where could policy, R&D or investment support capability development?

Proposed approach for the next phase

Evidence → Insights → Recommendations → Better-informed decisions

* A WIPO Technology SPARK report could be considered where findings have broader relevance for WIPO Member States

Identifying overlap with existing WIPO reports

LIST OF STRATEGIC TECHNOLOGIES

1. Digital technologies (artificial intelligence, big data, digital twins, cloud computing, edge computing, Internet of Things and blockchain).
2. Next-generation mobile network technologies.
3. Robotics and automation technologies.
4. Biotechnology and advanced biomedical technologies.
5. Energy and advanced materials technologies.
6. Semiconductor chip technologies.
7. Cybersecurity and quantum technologies.
8. Marine, ocean and subsurface technologies.
9. Aerospace and space technologies.
10. High-speed rail and urban rail technologies.

LIST OF STRATEGIC TECHNOLOGY PRODUCTS

Group 1: Strategic technology products that already have markets and can create large and direct impacts on economic development

1. Vietnamese large language models, virtual assistants and specialized artificial intelligence (AI).
2. Edge-processing AI cameras.
3. Digital twin platforms.
4. Cloud computing platforms.
5. Blockchain network infrastructure and origin traceability systems.
6. 5G/5G-Advanced mobile network equipment and systems.
7. Autonomous mobile robots and industrial robots.
8. Platforms, solutions and models serving smart manufacturing.
9. Cybersecurity and network security solutions for critical infrastructure and national databases.
10. Next-generation vaccines for human use.
11. Cell therapies (stem cells, immune cells) for human use.
12. Personalized medical product manufacturing systems applying 3D printing technology.
13. Smart biosensor systems.
14. Next-generation vaccines and biological preparations for use in animal husbandry, veterinary medicine, aquaculture, crop cultivation and plant protection.
15. Systems for production, harvesting and deep processing of agricultural products, by-products and biomass.
16. Next-generation plant varieties, livestock and aquatic breeds created from cell technology, gene editing and biotechnology.
17. Advanced materials and high-performance functional

materials for processing and manufacturing industries.

18. Advanced batteries, accumulators and integrated battery energy storage systems (BESS).
19. Systems for production, storage, transportation and distribution of green hydrogen and biofuels.
20. High-voltage and ultra-high-voltage electrical equipment; electric machines, electric motors and modern high-efficiency power transmission and drive systems.
21. Carbon capture, utilization and storage (CCUS) systems.
22. Unmanned aerial vehicles (UAVs) equipment and platforms; systems for management, detection, monitoring and countermeasures against UAVs.

Group 2: Technology products that create new growth drivers, foundation technologies for the future, and technologies ensuring autonomy in the fields of security and national defense

23. Specialized chips (application-specific / custom chips).
24. Quantum communication, quantum computing and quantum sensors.
25. Systems for extraction, deep processing and deep-processed products from minerals, oil and gas, and rare earths.
26. Systems, equipment, services and technology solutions for subsurface exploration, deep-sea operations, offshore structures and offshore energy.
27. Small modular nuclear reactors (SMR).
28. Satellites and low Earth orbit (LEO) satellite constellations for Earth observation.
29. High-speed railway construction works.
30. Industrial platforms, vehicles, equipment and integrated systems for high-speed rail and urban rail.

Process, timelines and partnership

Three publication series differing in scope, depth, timelines, resources and governance

	Name	Frequency	Length (pages)	Project duration	Breadth of analysis	Analyst resources	Requestor	Launch
	WITT	Biennial	140 – 200	18 months	Global	Elements outsourced to external contractors	DG chooses from shortlist	Flagship, in-person launch event
	PLR	1-2 per year	80 – 120	9-12 months	Global	In-house or elements outsourced to external contractors	Member State request or chosen by IP Analytics Section	Webinar launch
	Technology SPARK	2-4 per year	10 – 30	3-6 months	Global, regional or national	In-house analysis only	Member State request or chosen by IP Analytics Section	Direct to WIPO website

+ what happens when WIPO partners with another organization/institution/agency for a report?

Prioritizing technology areas and making the best use of patent analytics reports

Evidence → Insights → Recommendations → Better-informed decisions
